                                                   subunit (DCRS) polypeptides and the polynucleotides encoding them. The receptors, or their portions may be useful as phosphate labelling enzymes to label general or specific substrates. The subunits may also be functional immunogens to elicit recognising antibodies, or antigens capable of binding antibodies. A combination, e.g., including a DCRS can be used as an immunogen for the production of antisera or antibodies capable of distinguishing between other cytoking receptor family members. A purified DCRS can also be used as a reagent to detect antibodies generated in response to the presence of elevated levels of expression, or immunological disorders which lead to antibody production to the endogenous receptor. This sequence represents cDNA encoding the mouse DCRS7 polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           documentation_block:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to primate and rodent DNAX cytokine receptor subunit (DCRS) polypeptides and the polynucleotides encoding them. The receptors, or their portions may be useful as phosphate labelling enzymes to label general or specific substrates. The subunits may also be functional immunogens to elicit recognising antibodies, or antigens capable of binding antibodies. A combination, e.g., including a DCRS can be used as an immunogen for the production of antisera or antibodies capable of distinguishing between other cytokine receptor family members. A purified DCRS can also be used as a reagent to detect antibodies generated in response to the presence of elevated levels of expression, or immunological disorders which lead to antibody production to the endogenous receptor. This sequence represents mouse DCRS7 reverse

                                                                                                                                                                                                                                                                                                                                                                                                        lign seg 1/1 to: AAC85027
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention provides a new human cytokine receptor desinated Zcytor14. Caytor14 can be expressed by standard recombinant methodology. The encoding nucleic acid is useful for detecting the expression of a Zcytor14 gene in a biological sample. Anti-Zcytor14 antibodies can be used to screen biological samples in vitro for the presence of Zcytor14. Proteins, polypeptides and peptides having Zcytor14 activity can be administered to a subject who lacks an adequate amount of this polypeptide. For treating inflammation and conditions such as rheumatoid arthritic in contract and proteins.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                arthritis. In contrast, Zcytor14 antagonists (e.g. anti-Zcytor14 antibodies) can be used to treat a subject who produces an excess of Zcytor14. Zcytor14 nucleotide sequences can also be used to provide Zcytor14 to a subject. The present sequence represents a cDNA encoding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 8; Page 87-91; 112pp; English.

CC primers for PRO polypeptides of the invention. The sequences of the CC invention can be used to detect the presence of a tumour in a mammal by CC comparing the level of expression of a PRO polypeptide in a test sample CC of cells from the animal and a control sample of normal cells, whereby a CC higher level of expression in the test sample indicates the presence of a CC tumour in the mammal. Mammals include dogs, cats, cattle, horses, sheep, CC gigs, goats and rabbits but are preferably human. The polypeptides can be CC used to stimulate tumour necrosis factor (TMF) alpha release from human CC stimulate the proliferation or differentiation of chondrocyte cells. The CC Stimulate the proliferation or differentiation of chondrocyte cells. The CC susceptibility to tumour development, particularly adrenal, lung, colon, CC susceptibility to tumour development, particularly adrenal, lung, colon, CC susceptibility to tumour development, particularly adrenal, lung, colon, CC susceptibility colon cervical, or liver tumours, in mammalian CC subjects. The oligonucleotide probes specific for the PRO nucleic acids CC can be used for genetic analysis of individuals with genetic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel nucleic acids encoding PRO polypeptides, used to diagnose the presence of tumours, such as prostate and breast tumours, in mammals to screen for modulators of the compounds -

CC which is the human Interleukin 17 receptor, II-17RH2. A composition
CC containing ant/agonists to the PRO polypeptides or individual components
CC are useful for treating a mammal with an immune related disease, e.g.
CC systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis,
CC juvenile chronic arthritis, a spondyloarthropathy, systemic sclerosis, an
CC diopathic inflammatory myopathy, Sjogren's syndrome, systemic
CC vasculitis, sarcoidosis, autoimmune haemolytic anaemia, autoimmune
CC thrombocytopaenia, thyroiditis, diabetes mellitus, immune-mediated renal
CC disease, a demyelinating disease, an autoimmune or immune-mediated skin
CC disease, contact dermatitis, an allergic disease e.g. food
CI hypersensitivity, asthma, a transplantation associated disease, or a
CC chronic inflammatory demyelinating polypeuropathy. Treating a PRO1031 or
CR CRO1122 polypeptide agonist, or antagonist to the mammal. Numerous
CC examples of the diseases and disorders are given in the specification.

                                                                                                                                                                                                                                                                                           The present sequence is the coding sequence for a human PRO polypeptide (secreted and transmembrane). The PRO protein, and PRO agonists, PRO antagonists or anti-PRO antibodies are useful for preparation of a medicament useful in the treatment of a condition which is responsive to the PRO protein, agonists, antagonists or anti-PRO antibodies. The PRO protein may also be employed as molecular weight markers for protein electrophoresis. The PRO coding sequence has applications in molecular biology, including use as hybridisation probes, and in chromosome and

CC This sequence was found to be present on human chromosome 3.

CC AAY76124 to AAY76223 represent the secreted proteins encoded by the 97 cc AAY76124 to AAY76223 represent the secreted proteins encoded by the 97 cc e.g. by protein or genes and their corresponding secreted polypeptides are certified by protein or gene therapy. Also pathological conditions, can be compared by determining the amount of the new polypeptides in a sample cor by determining the presence of mutations in the new genes. Specific cuses are described for each of the 97 genes, based on which tissues they care most highly expressed in, and include developing products for the care diagnosis or treatment of cancer, tumours, developmental abnormalities and foetal deficiencies, blood disorders, diseases of the immune system, cu autoimmune diseases, inflammation, allergies, Alzheimer's and cognitive condisorders, atherosclerosis, diabetes, cardiovascular disorders, kidney consument of digestive/endocrine disorders, infections and AIDS. The sequences shown in AAY76224 to AAY76424 represent fragments of the

A combination, e.g., including a DCRS can be used as an immunogen for the production of antisera or antibodies capable of distinguishing between other cytokine receptor family members. A purified DCRS can also be used as a reagent to detect antibodies generated in response to the presence of elevated levels of expression, or immunological disorders which lead to antibody production to the endogenous receptor. This sequence represents cDNA encoding the human DCRS7 polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    subunit (PCRS) polypeptides and the polynucleotides encoding them. The receptors, or their portions may be useful as phosphate labelling enzymes to label general or specific substrates. The subunits may also be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Isolated antigenic human or mouse DNAX receptor subunit-like polypeptide useful for detecting antibodies generated in response presence of increased protein levels or immunological disorders -

which encode human secretory or membrane proteins represented by AAB88317 - AAB88419. Included in the invention are primers AAF93917 - AAF94295 and AAF96233 - AAF62235 which are used to isolate the cDNA sequences of the invention. The invention also includes methods for the production of antibodies directed against the proteins, and cDNA

This invention relates to nucleic acid sequences AAF93744 -

SEQ ID 263; 609pp + CD ROM; English.

Ratio: 4.061 alignment_block: US-09-899-471-2_COPY_21_440 x AAF93875 Align seg 1/1 to: AAF93875 from: 1 to: 2499 procein/membrane protein expression. The nucleic acids and complementary sequences may also be used as DNA probes in diagnostic assays (e.g. polymerase chain reactions (PCR)) to detect and quantitate the presence of similar nucleic acid sequences in samples. They may also be used to study the expression and function of secretory proteins/membrane polypeptides and their role in metabolism. The polypeptides may be used as antigens in the production of antibodies against them and in assays to identify modulators (agonists and antagonists) of expression and activity. The antibodies and antagonists be used as therapeutic agents to down regulate expression and activity. The antibodies and antagonists be used as diagnostic agents for detecting the presence of the polypeptides in samples (e.g. by enzyme linked immunosorbant assay (ELISA). Examples of diseases which may be treated include rheumatoid 718 147 899 130 618 113 sAlaLeuLeuGluValGlnValProAlaAspLeuValGlnProGlyGlnS 130 568 518 418 318 163 uThrGlnGlnLeuPro.. 268 CTGGAGAGGCTTGTGGGGCCTCAGGACGCTACCCACTGCTCTCCGGGCCT 317 Sequence 2499 BP; 418 A; 821 C; 764 G; 496 T; 0 other; sequences, which can be used in vaccines. The polynucleotide sequences can be used in gene therapy. The polynucleotide sequences and the proteins they encode may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate secretory 97 82 51 17 arthritis and 1 LeuGluArgLeuMetGluProGlnAspThrAlaArgCysSerLeuGlyLe 17 LeuGlnAlaGlnValValLeuSerPheGlnAlaTyrProIleAlaArgCy 113 ValLeuArgCysProGlnLysThrAspCysAlaLeuArgValArgValVa 67 uSerCysHisLeuTrpAspGlyAspValLeuCysLeuProGlySerLeuG 34 CGTCCTGCTGGAGGTGCAAGTGCCTGCTGCCCTTGTGCAGTTTGGTCAGTAlaGlyLysSerAspSerGluLeuGlnGluSerArgAsnAlaSer 96 AGTTTGGAGGAGCAGCTGACTCAGGGGTGGAGGAGCCTAGGAATGCCTCT diabetes.                                                                                                                                                                      The invention provides a new human cytokine receptor desinated Zcytor14. Ecytor14 can be expressed by standard recombinant methodology. The encoding nucleic acid is useful for detecting the expression of a Zcytor14 gene in a biological sample. Anti-Zcytor14 antibodies can be used to screen biological samples in vitro for the presence of Zcytor14. Proteins, polypeptides and peptides having Zcytor14 activity can be administered to a subject who lacks an adequate amount of this polypeptide, for treating inflammation and conditions such as rheumatoid arthritis. In contrast, Zcytor14 antagonists (e.g. anti-Zcytor14 antibodies) can be used to treat a subject who produces an excess of Zcytor14. Zcytor14 nucleotide sequences can also be used to provide Zcytor14 to a subject. The present sequence represents a cDNA encoding a variant of the human cytokine receptor Zcytor14, designated Zcytor14-1. The variant is a truncated form of the receptor polypeptide and lacks
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New polypeptide encoding a human cytokine receptor Zcytor14, treating inflammation e.g. rheumatoid arthritis -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                07-JUL-1999;

                                                                                                                                                     The invention provides a new human cytokine receptor desinated Zcytor14. Zcytor14 can be expressed by standard recombinant methodology. The encoding nucleic acid is useful for detecting the expression of a Zcytor14 gene in a biological sample. Anti-Zcytor14 antibodies can be used to screen biological samples in vitro for the presence of Zcytor14.
                          Proteins, polypeptides and peptides having 2cytor14 activity can be administered to a subject who lacks an adequate amount of this polypeptide, for treating inflammation and conditions such as rheumatoid arthritis. In contrast, Zcytor14 antagonists (e.g. anti-Zcytor14 antibodies) can be used to treat a subject who produces an excess of Zcytor14. Ccytor14 nucleotide sequences can also be used to provide zcytor14 to a subject. The present sequence represents the human cytokine receptor Zcytor14 degenerate nucleotide sequence.
                                                                                                                                                                                                                                                       Claim 8; Page 94-95; 112pp; English
                                                                                                                                                                                                                                                                                     New polypeptide encoding a human cytokine receptor Zcytor14, treating inflammation e.g. rheumatoid arthritis -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to primate and rodent DNAX cytokine receptor subunit (DCRS) polypeptides and the polynucleotides encoding them. The receptors, or their portions may be useful as phosphate labelling enzymes to label general or specific substrates. The subunits may also be functional immunogens to elicit recognising antibodies, or antigens capable of binding antibodies. A combination, e.g., including a DCRS can be used as an immunogen for the production of antisera or antibodies capable of distinguishing between other cytokine receptor family members. A purified DCRS can also be used as a reagent to detect antibodies generated in response to the presence of elevated levels of expression, or immunological disorders which lead to antibody production to the endogenous receptor. This sequence represents human DCRS7 reverse

                                                                                                            123
                                                                                                                                                                                  106
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  arthritis. In contrast, Zcytor14 antagonists (e.g. anti-Zcytor14 antibodies) can be used to treat a subject who produces an excess of Zcytor14. Zcytor14 nucleotide sequences can also be used to provide Zcytor14 to a subject. The present sequence represents a degenerate nucleotide sequence of a variant of the human cytokine receptor Zcytor14. The variant is a truncated form of the receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention provides a new human cytokine receptor desinated Zcytor14. Zcytor14 can be expressed by standard recombinant methodology. The encoding nucleic acid is useful for detecting the expression of a Zcytor14 gene in a biological sample. Anti-Zcytor14 antibodies can be used to screen biological samples in vitro for the presence of Zcytor14.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 1725 BP; 192 A; 226 C; 332 G; 216 T; 759 other;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Proteins, polypeptides and peptides having Zcytor14 activity can be administered to a subject who lacks an adequate amount of this polypeptide, for treating inflammation and conditions such as rheumatoid arthritis. In contrast, Zcytor14 antagonists (e.g. anti-Zcytor14

                                                             antiparkinsonian; and immunostimulant. The proteins and polynucleotides encoding them can be used in gene therapy, antisense therapy and vaccine production, The proteins and polynucleotides are useful for screening for agonists or antagonists of a protein and for the treatment and diagnosis of disorders associated with the activity of a protein e.g. inflammation, rheumatidid arthritis, septic shock, pandcreatitis, cardiac dysfunction, neuropathology, cardiac anaphylaxis, viral, bacterial, HIV and fungal infections, autoimmunity, genetic diseases, Taematopoietic disorders, anaemia, platelet disorders, thrombocytopaenia, wounds, burns, ulcers, osteoporosis, severe combined immunodeficiency, eczema, allergic rhinitis, asthma, diabetes, cancer, multiple sclerosis, depression,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            23-DEC-1999;

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, complymerase chain reaction (PCR) primers, oligomers, and for chromosome complymerase chain reaction (PCR) primers, oligomers, and for chromosome complymerase chain reaction (PCR) primers, oligomers, and for chromosome complymerase chain reaction of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques complyment (II) is useful for generating antipodies magnist it, detecting or companies and a citivity of (II) or to treat disease states involving companies. (II) is useful for generating antipodies magnist it, detecting or companies of the superessing of sites expressing (II). (I) and (II) are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating companies involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in codisorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in codisorations for ensuring in the primers of data and products dependent on DNA and companies. AAS64197-AAS94564 represent novel human codisoration sequences of the invention.

Content the sequence and for this patent did not appear in the printed content for the vine in the printed at formal companies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           DR XX PA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      seq_name: /STDS1/gcgdata/geneseq/geneseqn-embl/NA2001B.DAT:AAS78822
